

NFC Frontend supporting challenging RF environment for payment, physical access control

PN5190

Last Updated: Mar 26, 2025

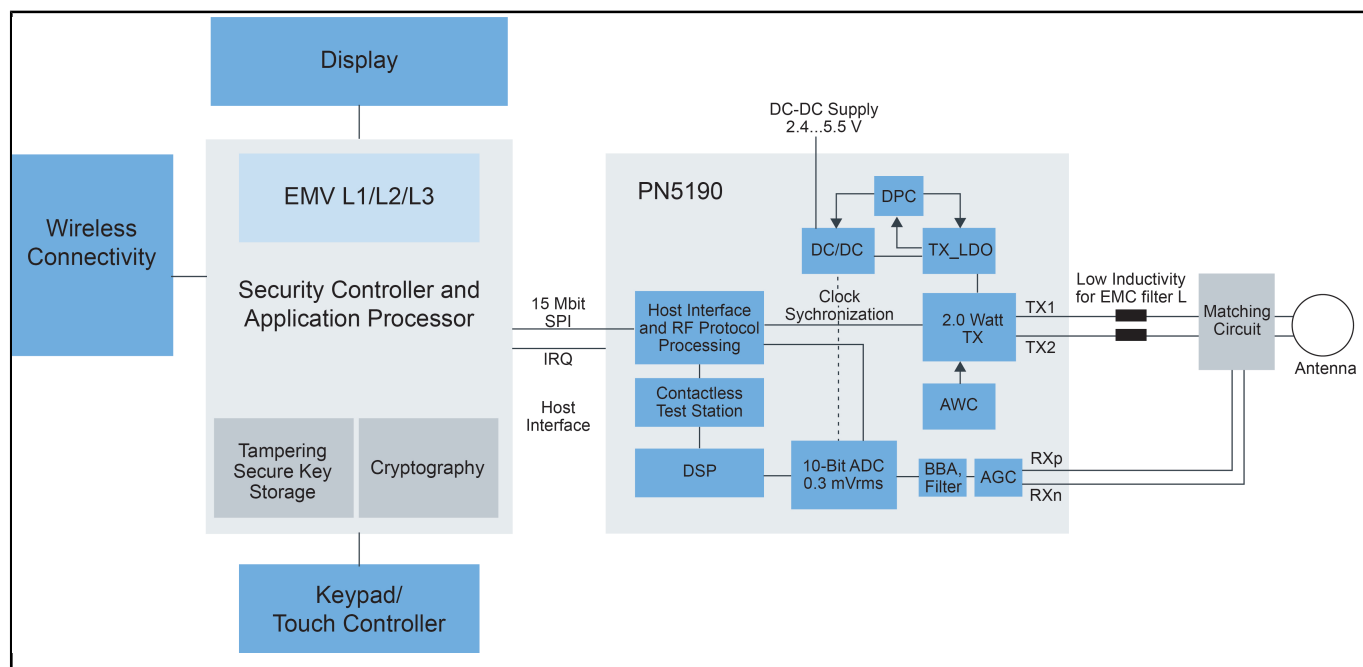

Please check the new online [NFC Antenna Tool](#) for tag and reader devices.

As a full NFC frontend with High RF output (2W) and High receiver sensitivity, the NXP PN5190 is a robust solution for payment terminals and all readers that need to generate a strong RF field in a difficult environment.

The PN5190 simplifies design while ensuring interoperability with a broad range of smartcards and mobile phones and allows to achieve EMVCo 3.1 analog and digital L1 compliancy.

The High output power and receiver sensitivity allow the design of small antennas maintaining the communication range of a larger antenna. This is especially interesting for designs with limited space for a large antenna. Efficient power-saving modes allow long battery lifetime for battery-powered systems, including residential access locks.
